

Problem Statement:

You work for XYZ Corporation. Your team is asked to deploy similar architecture multiple times for testing, development, and production purposes. Implement CloudFormation for the tasks assigned to you below.

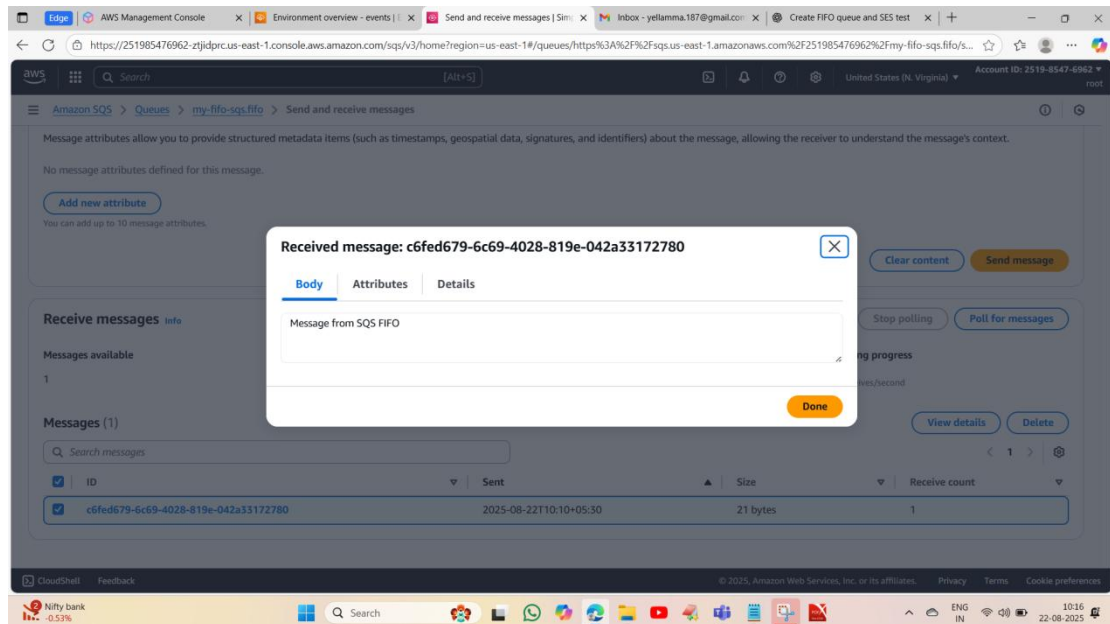

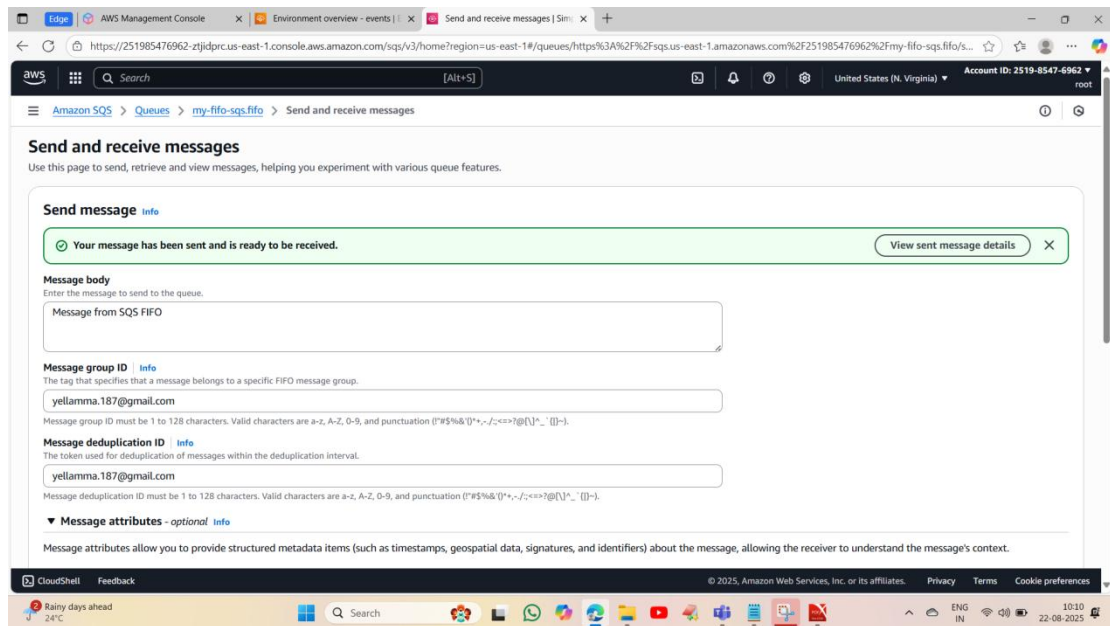

Tasks To Be Performed:

1. Create a FIFO SQS queue and test by sending messages.
2. Register your mail in SES and send a test mail to yourself.

1. Create a FIFO SQS queue and test by sending messages.

The screenshot shows the 'Create queue' page in the AWS Management Console. The 'FIFO Info' section is selected, indicating that first-in-first-out delivery and message ordering are preserved. The queue name is 'my-fifo-sqs.fifo'. The configuration section shows the following settings: Visibility timeout is 30 seconds, Message retention period is 4 days, Delivery delay is 0 seconds, and Maximum message size is 1024 KIB. A warning message states: 'You can't change the queue type after you create a queue.'

The screenshot shows the 'Queue details' page for the 'my-fifo-sqs.fifo' queue. A green notification banner at the top states: 'Queue my-fifo-sqs.fifo created successfully. You can now send and receive messages.' The details section shows the queue name, type (FIFO), ARN, and URL. The 'Access policy' section is visible at the bottom, with an 'Edit' button.

2. Register your mail in SES and send a test mail to yourself.

Create identity

An identity is a domain, subdomain, or email address you use to send email through Amazon SES. Identity verification at the domain level extends to all email addresses under one verified domain identity.

Identity details info

Identity type

☐ Domain
To verify ownership of a domain, you must have access to its DNS settings to add the necessary records.

☒ Email address
To verify ownership of an email address, you must have access to its inbox to open the verification email.

ⓘ Sending email from an email address identity without having the domain identity verified will result in your message being quarantined or rejected depending on the domain's DMARC policy. [Learn more about DMARC and how to look up a domain's DMARC policy.](#)

Email address

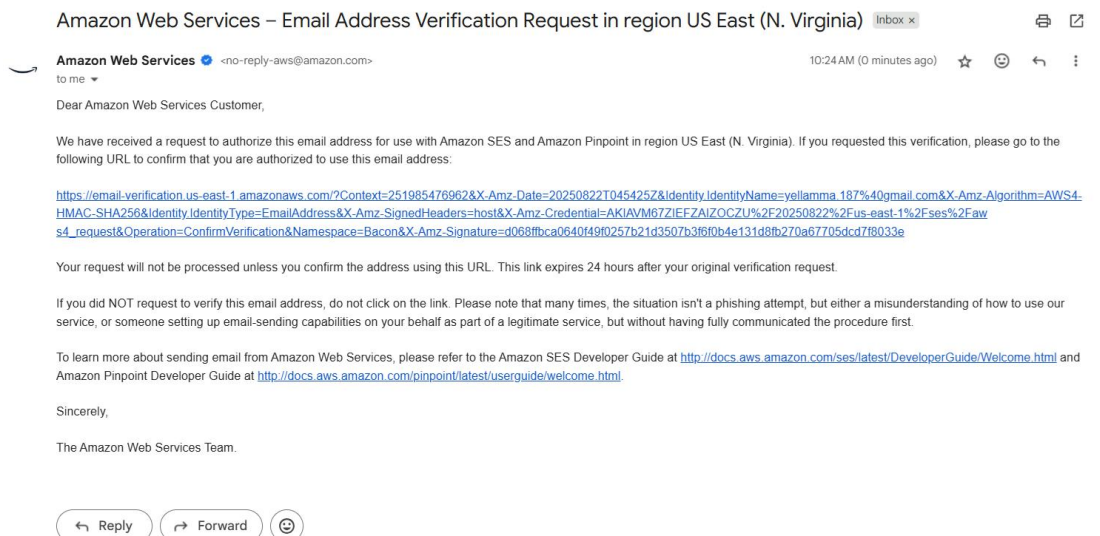

yellamma.187@gmail.com

Email address can contain up to 320 characters, including plus signs (+), equals signs (=) and underscores (_).

☐ Assign a default configuration set
Enabling this option ensures that the assigned configuration set is applied to messages sent from this identity by default whenever a configuration set isn't specified at the time of sending.

☐ Assign to a tenant
Assigning an identity to a tenant enables the tenant to use the identity for sending emails. The same identity can be assigned to multiple tenants or isolated to a single tenant.

Amazon SES > Configuration: Identities > yellamma.187@gmail.com > Send test email

Send test email [Info](#)

The Amazon SES mailbox simulator lets you test how your application handles different email sending scenarios. Emails that you send to the mailbox simulator do not count towards your sending quota or your bounce and complaint rates. [Learn more](#)

Message details

Email format

☒ **Formatted**
Choose this option if you want to construct a simple test message using the form provided. SES takes the information entered in the form and parses it into email format for you.

☐ **Raw**
Choose this option if you want to send a more complex test message, such as one that uses HTML or includes attachments. This option requires you to format the entire message yourself.

From-address

yellamma.187@gmail.com

Scenario [Info](#)

Choose the email sending scenario that you want to simulate. Each scenario corresponds to a different recipient email address managed by the mailbox simulator. To specify a custom recipient, select Custom.

Custom
Use a recipient address of your own

Custom recipient

While your account is in the Amazon SES sandbox, you can only send test emails to other verified identities. If you've verified an identity at the domain level, you can send a test email to any email address under that verified domain.
